COACH LUKI

TRAINING & NUTRITION GUIDE

The 3 mistakes keeping you stuck
and how to fix them.

A free guide by Coach Luki

You're training.

You're trying to eat better.

You want to see results.

You're working out...

so why isn't your body changing?

I hear this all the time:

- "I train, but I don't see real progress."
- "I don't know what actually works."
- "I start strong... but I can't stay consistent."
- "I feel stiff / disconnected from my body."

And to be honest, I see the frustration behind those words every single week. People are putting in effort but not getting the results they expect.

And here's the truth:

In most cases, it's not because you're not trying hard enough. It's because you're stuck in a few simple mistakes that quietly keep you in the same cycle.

Let me break them down for you and more importantly, show you how to get out of them and finally take control of your training and your habits.

It's not about doing more.

It's about doing the right things, the right way.

You're not the problem. Your approach is.

THIS GUIDE IS FOR YOU IF:

You train regularly but don't see real progress

You feel inconsistent or stuck in cycles

You want to build muscle or lose fat

You want to actually understand your body

So what are the 3 most common mistakes you're making at the gym?

MISTAKE #1

No Real Training System

Most people don't train. They just 'work out'. One day it's legs, next day push, next day something random they saw online.

No structure. No progression. No direction.

And that's exactly why nothing changes.

What's actually missing? Progressive overload.

Progressive overload means systematically increasing the training stimulus over time in a controlled way. This is the foundation of every real transformation.

How do we make sure we're progressively overloading?

This can be done by manipulating:

1. Mechanical Load
Increasing resistance (weight or external load)

2. Volume
Increasing total work (sets x reps x load)

3. Intensity of Effort
Training closer to muscular failure (higher motor unit recruitment)

4. Movement Complexity / Range
Increasing range of motion or exercise difficulty (especially relevant in bodyweight training)

Why this matters

Without progressive overload:

- Muscle protein synthesis returns to baseline
- Strength adaptations plateau
- Body composition changes stall
- Performance stabilizes (no further improvement)

The body only adapts when it is forced to handle more than it is currently used to.

MISTAKE #2

Not Understanding the Movements

This is one of the biggest hidden problems. People do exercises but they don't actually know what they're training.

Ask yourself:

- What is the actual goal of this movement?
- What muscle am I supposed to feel?
- Am I actually loading that muscle, or just moving weight?

Most people never ask this. They just copy exercises and hope for the best.

Technique comes first. Always.
Because if your technique is off: the wrong muscles take over, we load the wrong tissues, results slow down or disappear completely.

Then comes INTENSITY.
I see too many people half-assing their workouts. Not because they don't care, but because they've never been taught to actually train with intent.

Here's the shift you need:

- Every rep has a purpose
- Every set has focus
- Every movement is controlled and purpose-driven
- You are not just "getting through it"

You are building something. Training should be enjoyable. But enjoyment doesn't mean lack of effort.

You are not fragile. You are not weak.
You are capable of much more than you think right now. Trust yourself. Push yourself (safely). And actually show up with intent.

MISTAKE #3

No Structure in Nutrition

Let's clear this up once and for all: If you want to build muscle or lose fat, nutrition is not optional. It is the foundation.

Start here: Protein is non-negotiable.

If you're not hitting your protein intake consistently, your progress will always be limited.

But nutrition is NOT just protein.

We also need structure around:

- Carbohydrates (energy & performance)
- Fats (hormones & recovery)
- Total calories (body composition control)

The mistake most people make:

They jump from one diet to another. Low carb, keto, fasting, "clean eating", back to random eating. No consistency. No system. Just frustration.

What actually works:

A simple, repeatable system you can follow long-term. Not a diet. A structure. Because results don't come from perfect weeks. They come from boring consistency over time.

KEY PRINCIPLES:

Individualization & Simplicity: The best diet is the one you can consistently follow.

Lifestyle, Not a Phase: A healthy diet should become part of your lifestyle.

Consistency Over Perfection: Progress is not linear. Stay consistent.

Energy Balance is Key: Weight management depends on calories in vs. out.

Results Through Compliance: The most effective diet is the one you stick to.

THE LUKI METHOD

My approach is simple:

I don't just train your body. I teach you how to use it.

---

1. MOVEMENT

Before intensity comes control.

- Learn how your body is designed to move
- Build strength through proper movement patterns
- Improve mobility
- Reduce pain & prevent injuries

Whether you're using bodyweight (calisthenics), free weights, or machines, each method serves a purpose when used correctly. This is the foundation everything else is built on.

---

2. NUTRITION

Your body can only change based on what you consistently give it.

- **Protein is non-negotiable**
  Supports muscle growth, recovery, and keeps you full.
- **Calories determine direction**
  Whether you lose fat or build muscle comes down to total energy intake.
- **Carbs & fats fuel performance**
  Not the enemy, but tools that need to be used correctly.

Most people don't struggle because they lack information.
They struggle because they lack structure and consistency.

3. LIFESTYLE

Anyone can be disciplined for a week.

Real progress comes from what you can sustain for life.

And that's the part most people overlook. They chase short-term results, quick fixes & extreme diets. But none of that lasts.

Your results are a reflection of your habits.

Not what you do once. Not what you do when you feel motivated. What you do consistently, without thinking about it.

This is the real goal:

Not just to "get in shape"...

But to build habits that:

- Support your energy every day
- Make training part of your lifestyle
- Create structure instead of chaos
- Give you a sense of control

Because once you build those habits, you don't have to rely on motivation anymore. You don't start over every Monday. You simply stay consistent, almost automatically.

And this goes beyond fitness.

- You show up differently in your day
- You have more energy and focus
- You feel more in control of yourself
- You build confidence through action

Not just a better body.

A stronger, more disciplined version of yourself.

If you've made it this far, you already know:

What you've been doing isn't the problem. It's the lack of structure behind it.

You don't need more random workouts.

You don't need another diet.

You need a system that actually works for you.

This is exactly what I help my clients build. A structured approach that combines:

- **Movement**
- **Nutrition**
- **Lifestyle**

So you can finally:

- See real progress
- Feel in control of your body
- Build results that actually last
